Hospital Maria-Hilf provides primary healthcare as well as state-of-the-art services in a wide range of medical specializations. Operating 524 beds, the hospital offers medical care for somatic and psychiatric diseases, in addition to services offered at the rehabilitation facility. Multidisciplinary close cooperation between all members of staff ensures the provision of comprehensive medical care to all patients. Our experts work in different interdisciplinary centers, implementing the highest standards of care. Closely located to Düsseldorf International Airport, the hospital can be reached by car within 15 minutes. As a hospital owned by the Catholic Church, our activities are mainly focused on the welfare of human beings. This is why we are keen to implement a holistic approach, offering a comprehensive range of diagnostic and therapeutic services.

Disorders of the cardiovascular system and the lungs are the most common diseases, wherefore the Department of Cardiology and Pulmonology has been established in our hospital. Due to the close cooperation of the heart and lung specialists combined with the modern equipment our facilities provide differentiated diagnoses and professional therapies, performed at three general wards and a multidisciplinary intensive care unit. For patients with heart rhythm instability we provide a portable patient sided monitoring system for cardiac telemetry, which allows these patients to move inside a defined area without limitations and nevertheless permanently ECG-controlled.

Cardiology: A focus of this clinic is the comprehensive non-invasive and invasive diagnosis of cardiac and vascular diseases, their treatment and prevention. The full range of diagnostic levels related to coronary heart diseases is available, starting with ECG, stress echocardiography (drug and bicycle), cardiac MRI, up to heart catheterization, which enables coronary intervention (balloon dilatation, stent implantation).

Pulmonary Diseases: Our treatment spectrum includes pneumonia, acute infections of the respiratory tract in previously disordered lungs, chronic obstructive pulmonary disease, sleep apnea syndrome, respiratory failure, interstitial lung disease (especially pulmonary fibrosis), pulmonary hypertension and malignant diseases of the lungs and the pleura.

Certified Medical Specializations

- Surgery
  - Department of General, Visceral and Thoracic Surgery
- Department of Coloproctology
- Department of Orthopedics and Trauma Surgery
- Cardiology, Pneumology and Oncology
